Abstract. In this paper, an enhanced model-free adaptive iterative learning control (EMFAILC) method is proposed, which is applied for a class of nonlinear discrete-time systems with load disturbance and random data dropout. This method is a data-driven control strategy and only the I/O data are required for the controller design.

Iterative Learning Control in Health Care: Electrical Stimulation and Robotic-Assisted Upper-Limb Stroke Rehabilitation. Abstract: Annually, 15 million people worldwide suffer a stroke, and 5 million are left permanently disabled. A stroke is usually caused when a blood clot blocks a vessel in the brain and acts like a dam, stopping the blood reaching the regions downstream.

Iterative Learning Control (ILC) allows to iteratively compensate for and, hence, remove this repetitive error. In the thesis different aspects of iterative learning control are covered. Although stability is the most important in practice the design aspect is also highlighted.

Since the generation of droplets is a highly repetitive process, feedforward control by an Iterative Learning Controller (ILC) seems a proper choice. An important advantage of ILC is that calculations can be performed o-line. Active control demands for proper actuator and sensor functionality.
