Distributed computing is a field of computer science that studies distributed systems. A distributed system is a system whose components are located on different networked computers, which communicate and coordinate their actions by passing messages to one another. The components interact with one another in order to achieve a common goal. Three significant characteristics of distributed

When distributed systems first appeared, they were programmed in traditional sequential languages, usually with the addition of a few library procedures for sending and receiving messages. As distributed applications became more commonplace and more sophisticated, this ad hoc approach became less satisfactory.

Distributed computing studies the models, architectures, and algorithms used for building and managing distributed systems. As a general definition of the term distributed system, we use the one proposed by Tanenbaum et. al : A distributed system is a collection of independent computers that appears to its users as a single coherent system.

Programming languages for distributed system - Stack Overflow

Distributed computing is a computing concept that, in its most general sense, refers to multiple computer systems working on a single problem. In distributed computing, a single problem is divided into many parts, and each part is solved by different computers. As long as the computers are networked, they can communicate with each other to solve the problem.

Programming Distributed Computing Systems | The MIT Press

Distributed computing is a model in which components of a software system are shared among multiple computers. Even though the components are spread out across multiple computers, they are run as one system. This is done in order to improve efficiency and performance. In a narrow form, distributed computing is limited to programs with components shared among computers within a limited geographic area.
