Stress Neuroendocrinology And Neurobiology Handbook

Stress: Neuroendocrinology and Neurobiology: Handbook of Stress Series, Volume 2, focuses on neuroendocrinology, the discipline that deals with the way that the brain controls hormonal secretion, and in turn, the way that hormones control the brain. There have been significant advances in our understanding of neuroendocrine molecular and epigenetic mechanisms, especially in the way in which stress-induced hormonal and neurochemical changes affect brain plasticity, neuronal connectivity, and ...

Abstract. Stress leads to increased activity of the sympathetic nervous system (SNS) and of the hypothalamic-pituitary-adrenal (HPA) axis. Stimulation of the latter induces the release of glucocorti- coids (GCs) from the adrenal cortex. The multiple effects of GCs in the brain are the focus of the current chapter. ...

Stress: Neurobiology and Neuroendocrinology

Stress in mammals triggers a neuroendocrine response mediated by the hypothalamic-pituitary-adrenal (HPA) axis and the autonomic nervous system (ANS). Increased activity of these two systems...

While neuroendocrinology has afforded us a "window into brain metabolism," which has been exploited extensively in stress research (reviewed in several chapters of this volume, as well as volume 2 of the Handbook of Stress, series: "Stress: Neuroendocrinology and Neurobiology"), modern in vivo imaging, in particular positron emission tomography (PET), is able to detect very small (nano- to picomolar) signals in brain metabolism and pharmacology, and can localize such signals ...

The nervous system communicates with peripheral tissues through nerve fibres and the systemic release of hypothalamic and pituitary neurohormones. Communication between the nervous system and the largest human organ, skin, has traditionally received little attention. In particular, the neuro-regulat ...
